TELEMEDICINE TECHNOLOGIES has been awarded the Patient Pathway Management contract by UniHA* for the provision of the VisionHM software solution.

This provision is part of Telemedicine Technologies' technological alliance approach (TECH- Alliance), which aims to federate a group of suppliers selected for the quality and innovative relevance of their products, in order to create integrated and modular offers with very high added value around its CleanWEB business solution, in particular for its numerous academic and hospital customers.

The epidemic crisis has made a necessity obvious: the digital transformation of health establishments is now experiencing an unprecedented acceleration and the challenge of intelligent and efficient coordination of all resources (human, material) around specialised patient pathways is undoubtedly central, as it is the driving force behind better organisation, both for the benefit of health professionals, hospital management, and the patients themselves.

The VisionHM solution is unique in that it addresses this problem in a global way, with a model that can easily be replicated from one type of care to another. It assumes, of course, a strong interoperability with the other "business" applications of the hospital's information system: the computerised patient file, of course, but also imaging, block management, etc.

In institutions, the solution allows for the optimization of the occupation of the workstations, better management through the provision of adapted dashboards and also accessibility to patient data in their journey to the city (City-Hospital Platform).

The integration of CleanWEB, a clinical study management software, with VisionHM is part of a convergence logic between care and research, at a time when the continuous evaluation of practices, the development of e-health and the use of artificial intelligence, the development of real-life studies and national registers of specialities are all challenges to be taken up by a hospital sector already under pressure.

This provision obtained from UniHA is the fruit of a year of collaboration between Dapsys, the Swiss editor of VisionHM, and Telemedicine Technologies, editor of the CleanWEB solution. It will benefit fully from the already substantial presence of Telemedicine Technologies on the French market.

For hospitals and GHTs, this availability is a guarantee that they will be able to benefit quickly from the proposed improvements, by activating Lot 9 of the *"Software solution for analysing and optimising medical activity and care paths with associated support services"* contract.

About DAPSYS

Dapsys is the publisher of the VisionHM solution for patient management in healthcare institutions. VisionHM allows for simple programming of each step of the patient's journey, in connection with the various business applications (appointments, radiology, operating room, DPI, etc.). It is suitable for both simple consultations and complex, intra- or inter-institutional (GHT type), surgical interventions, medical check-ups and obstetrical procedures. The staff is permanently supported, thanks to precise indicators available at any time.
